

L3

Layout & Nesting

Divs, containers, semantic HTML, the box model

CHEAT SHEET

"Individual bricks do not make a building. Group them. Stack them. Organize them. That is layout."

<div>

Generic container. Groups elements for styling. No visual appearance on its own.

Nesting

Placing elements inside other elements. Inner = child. Outer = parent.

<header>

Semantic top section. Holds logo, nav, and page title area.

<nav>

Navigation container. Holds links for moving around the site.

<main>

Primary content area. One per page. Holds all major sections.

<section>

Thematic group. Major page areas: About, Projects, Contact.

<footer>

Bottom of page. Copyright, links, contact info.

class=

Gives an element a reusable label. CSS uses it to apply styles.

Parent / Child

Outer element = parent. Inner = child. CSS can cascade parent to child.

Box Model

Every element = a box: content + padding + border + margin.

SEMANTIC PAGE SKELETON

```
HTML
<header>                -- Top: logo, nav
  <nav><a href="/">Home</a></nav>
</header>
<main>                  -- Primary content (one per page)
  <section>
    <h1>Welcome</h1>
    <p>Main content here.</p>
  </section>
</main>
<footer>Built with MiM</footer>
```

BOX MODEL — EVERY ELEMENT IS A BOX
