

ZEN'S CODING REALM

FULL HTML + CSS CHEAT SHEET

Method in Motion Coding | Zen - The Creative Coder

LESSON 1 - What Is Code?

Code	Step-by-step instructions a computer can read and follow.
HTML	HyperText Markup Language - the language used to structure web pages.
Tag	A label written inside angle brackets that tells the browser what a piece of content is.
Browser	The program that reads HTML and turns it into a webpage you can see and use.
Element	For many beginner HTML elements: opening tag + content + closing tag together.

MEMORY STICKY: Open -> content -> close is a pattern you will see again and again. Tiny slash, huge job: / helps tell the browser when many elements are finished.

```
<h1>Hello, I'm Zen.</h1>
<p>I build things with code.</p>
```

LESSON 2 - Your First HTML Tag

Opening tag	Starts many HTML elements. Example: <p>.
Closing tag	Ends many HTML elements. It includes a slash. Example: </p>.
Angle brackets < >	Wrap tag names so the browser recognizes them as HTML instructions.
<h1>	The main, most important heading on a page.
<h2> to <h6>	Heading levels used to organize sections and smaller sections. They show hierarchy, not just visual size.
<p>	A paragraph. Use it for sentences and explanations.
Attribute	Extra information placed inside an opening tag.
href	An attribute commonly used on <a> links to tell the browser where the link should go.
<a>	Anchor tag - creates a link.

MEMORY STICKY: A heading says, 'LOOK OVER HERE!' A paragraph says, 'Cool - now let me explain.'

```
<h1>My Animal Website</h1>
<h2>Dogs</h2>
<h3>What Dogs Eat</h3>
<p>Dogs need food, water, play, and care.</p>
<a href="https://example.com">Learn more</a>
```

LESSON 3 - Colors & Style with CSS

CSS	Cascading Style Sheets - the language used to style HTML.
Selector	Targets which HTML element you want to style. Example: h1.
Property	What you want to change. Examples: color, font-size, background.
Value	What you set the property to. Examples: pink, 2rem, #ff6baa.
{ }	Curly braces wrap the CSS declarations that belong to a selector.
:	A colon separates a CSS property from its value.
;	A semicolon ends a CSS declaration.
#	Starts a hex color code, such as #ff6baa.

MEMORY STICKY: selector { property: value; } - who to style, what to change, what to change it to.

```
h1 {  
  color: #ff6baa;  
  font-size: 2rem;  
}
```

LESSON 4 - Build Your Own Page

<code><!DOCTYPE html></code>	The declaration that tells the browser this is a modern HTML document. It goes first.
<code>!</code>	The exclamation mark is part of the special DOCTYPE declaration.
<code><html></code>	Wraps the whole HTML document - think of it as the whole person: head, body, everything included.
<code><head></code>	Holds important information and resources about the page rather than the main content visitors see inside the webpage.
<code><title></code>	Names the browser tab. It lives inside head. It is NOT the big visible heading on the page.
<code><style></code>	One place CSS can live inside a simple HTML page. It belongs inside head.
<code><body></code>	Holds the main visible webpage content: headings, paragraphs, images, links, buttons, and more.
<code><h1></code>	The main visible heading inside the body.
<code><p></code>	A visible paragraph inside the body.

WEBPAGE ANATOMY: `html` = the whole person | `head` = information/resources about the page | `title` = the page's name on the browser tab | `body` = the main content visitors see.

```
<!DOCTYPE html>
<html>
<head>
  <title>My First Webpage</title>
  <style>
    h1 { color: #ff6baa; }
  </style>
</head>
<body>
  <h1>Hello, World!</h1>
  <p>I built this webpage from scratch.</p>
</body>
</html>
```

SYMBOLS REFERENCE

<code><</code>	Left angle bracket - begins the tag syntax.
<code>></code>	Right angle bracket - closes the tag syntax.
<code></</code>	Left angle bracket + slash - begins a closing tag.
<code>/</code>	Slash - helps mark many closing tags, such as <code></p></code> .
<code>!</code>	Used in <code><!DOCTYPE html></code> as part of the special declaration.
<code>{ }</code>	Curly braces - wrap CSS declarations.

:	Colon - separates a CSS property from its value.
;	Semicolon - ends a CSS declaration.
#	Pound/hash sign - begins a hex color value.

BUILD ORDER TO REMEMBER: DOCTYPE -> html -> head -> title/style -> body -> visible content -> close body -> close html.

ZEN'S QUICK MEMORY CHECK

1. What is the first line? `<!DOCTYPE html>`
2. Where does the browser-tab name live? Inside `<title>` in `<head>`.
3. Where does the visible main heading live? `<h1>` inside `<body>`.
4. Which heading is most important? `<h1>`.
5. What pattern builds many beginner elements? Open -> content -> close.
6. What does CSS do? Styles the HTML content.
