THINK LIKE A PROGRAMMER

VOLUME 3: BUILDING DIGITAL WORLDS

01 // 10 // 01 // 10

Exploring Websites, Apps, Design,
Game Development, and Future Technology

< > . { } . [] . < >

METHOD IN MOTION

WELCOME DIGITAL CREATOR

Technology is built by creators, designers, programmers, and innovators. Websites, apps, games, robots, and digital experiences all begin with ideas brought to life through code and creativity. In this volume, future programmers will explore the tools and technologies used to build digital worlds, interactive experiences, and the future of technology.

INSIDE THIS VOLUME

// HTML	// Databases
// CSS	// Game Design
// Apps	// Cyber Safety
// Websites	// Robotics
// Cloud Computing	// Future Technology

The future is built by creators who understand technology.

HTML

WHAT IS IT?

HTML is the language used to build web pages. It tells browsers what content should appear on a screen, like titles, pictures, buttons, and paragraphs. Coders use HTML to create the structure of websites.

KEY TERMS

HTML, Website, Structure, Browser

REAL LIFE USE

Every website you visit uses HTML.

TRY THIS

Open a website and look at how information is organized.

QUICK TIP

HTML builds the structure of web pages.

CSS

WHAT IS IT?

CSS is used to style websites and make them look creative and organized. Coders use CSS to change colors, fonts, spacing, layouts, and animations. CSS helps websites feel unique and visually appealing.

KEY TERMS

CSS, Style, Design, Layout

REAL LIFE USE

Changing colors on a website uses CSS.

TRY THIS

Name one color combination you would use on a website.

QUICK TIP

CSS controls how websites look.

JAVASCRIPT

WHAT IS IT?

JavaScript makes websites interactive and dynamic. Coders use JavaScript to create animations, buttons, games, and moving elements on web pages. Without JavaScript, websites would feel much less interactive.

KEY TERMS

JavaScript, Interactive, Actions, Website

REAL LIFE USE

A button changing something on a webpage uses JavaScript.

TRY THIS

Think of one interactive feature you like online.

QUICK TIP

JavaScript adds movement and interaction.

APPS

WHAT IS IT?

Apps are software programs designed to complete specific tasks. Some apps help people communicate, learn, shop, create, or play games. Coders build apps to solve problems and improve daily life.

KEY TERMS

App, Software, Program, Device

REAL LIFE USE

A weather app helps people check forecasts quickly.

TRY THIS

Name one app you use every day.

QUICK TIP

Apps are designed to help users complete tasks.

WEBSITES

WHAT IS IT?

Websites are collections of connected web pages on the internet. Businesses, schools, creators, and organizations use websites to share information and services with people around the world.

KEY TERMS

Website, Internet,
Pages, Browser

REAL LIFE USE

A school website shares important information online.

TRY THIS

Think of a website you visit often.

QUICK TIP

Websites connect information online.

SERVERS

WHAT IS IT?

Servers are powerful computers that store and send information to other devices. When someone opens a website or app, servers help deliver the content quickly. Servers help keep the internet running.

KEY TERMS

Server, Internet, Store, Connect

REAL LIFE USE

Streaming a movie online uses servers.

TRY THIS

Think about how many people use the internet at once.

QUICK TIP

Servers help deliver online information.

CLOUD COMPUTING

WHAT IS IT?

Cloud computing allows information and programs to be stored online instead of only on one device. People use the cloud to save photos, files, games, and apps so they can access them anywhere.

KEY TERMS

Cloud, Storage, Online, Access

REAL LIFE USE

Saving photos to Google Drive uses cloud computing.

TRY THIS

Name something you might store in the cloud.

QUICK TIP

Cloud systems help people access files anywhere.

DATABASES

WHAT IS IT?

Databases organize and store large amounts of information. Apps and websites use databases to save usernames, passwords, scores, and other important data. Databases help information stay organized and searchable.

KEY TERMS

Database, Information, Organize, Store

REAL LIFE USE

A game saving player scores uses a database.

TRY THIS

Think about information a school might organize digitally.

QUICK TIP

Databases help organize digital information.

GAME DESIGN

WHAT IS IT?

Game design combines creativity, storytelling, coding, and problem solving. Designers create rules, challenges, characters, and worlds for players to explore. Good game design keeps players engaged and entertained.

KEY TERMS

Game Design, Rules, Player, Creativity

REAL LIFE USE

Building levels in a video game is part of game design.

TRY THIS

Describe one idea for your own game.

QUICK TIP

Game design mixes creativity with technology.

CYBER SAFETY

WHAT IS IT?

Cyber safety means staying safe while using the internet and technology. It includes protecting passwords, avoiding scams, and sharing information carefully online. Learning cyber safety helps people become responsible digital users.

KEY TERMS

Cyber Safety, Internet, Password, Security

REAL LIFE USE

Using strong passwords helps protect accounts.

TRY THIS

Name one rule for staying safe online.

QUICK TIP

Online safety is an important digital skill.

ROBOTS

WHAT IS IT?

Robots are machines programmed to complete tasks automatically. Some robots help in factories, hospitals, homes, or even space exploration. Coders program robots using instructions and logic.

KEY TERMS

Robot, Machine, Program, Instructions

REAL LIFE USE

Robot vacuums clean floors automatically.

TRY THIS

Think of one job a robot could help with.

QUICK TIP

Robots follow programmed instructions.

DIGITAL ART

WHAT IS IT?

Digital art is artwork created using computers, tablets, or software. Artists use technology to design animations, illustrations, graphics, and videos. Coding and creativity often work together in digital design.

KEY TERMS

Digital Art, Design, Creative, Technology

REAL LIFE USE

Animation movies use digital art tools.

TRY THIS

Name something creative you could make digitally.

QUICK TIP

Technology can be used for creativity.

AUGMENTED REALITY

WHAT IS IT?

Augmented reality adds digital elements to the real world using technology. AR can place animations, filters, or objects onto screens and environments. Many games and apps use augmented reality features.

KEY TERMS

Augmented Reality, AR, Digital, Interactive

REAL LIFE USE

Face filters on social media use augmented reality.

TRY THIS

Think about how AR could make learning more fun.

QUICK TIP

AR mixes digital content with the real world.

VIRTUAL REALITY

WHAT IS IT?

Virtual reality creates immersive digital worlds people can explore using special headsets and technology. VR is used for gaming, learning, training, and simulations. It allows users to experience interactive virtual spaces.

KEY TERMS

Virtual Reality, VR, Simulation, Technology

REAL LIFE USE

VR games place players inside digital worlds.

TRY THIS

Imagine a world you would create in VR.

QUICK TIP

VR creates immersive digital experiences.

FUTURE TECHNOLOGY

WHAT IS IT?

Future technology includes inventions and ideas that may change how people live, learn, and communicate. Coders, engineers, and creators help build new technologies every day. Technology continues to evolve and shape the future.

KEY TERMS

Future Technology, Innovation, Invention, Ideas

REAL LIFE USE

Self-driving cars are an example of future technology.

TRY THIS

Think of one invention you would create someday.

QUICK TIP

Technology continues to evolve over time.

VOLUME 3 SUMMARY

BUILDING DIGITAL WORLDS

01 // 10 // 01 // 10

In this volume, you explored the creative side of technology and discovered how programmers build the digital experiences people use every day. You learned how websites, apps, databases, servers, and cloud systems work together to power the modern internet.

You also explored how coding and creativity combine to create games, digital art, robots, virtual reality, and augmented reality experiences. These technologies allow creators to design interactive worlds, solve problems, and imagine new ways for people to learn, communicate, and play.

As technology continues to evolve, future programmers, designers, and innovators will help shape the next generation of digital experiences.

KEY DEFINITIONS

HTML — The structure and foundation of a web page.

CSS — The design and visual style of a website.

JavaScript — Adds movement, actions, and interaction to websites.

Apps — Software programs designed to complete tasks.

Websites — Connected web pages found online.

Servers — Computers that deliver online information and content.

Cloud Computing — Storing files, games, and programs online.

Databases — Organized collections of digital information.

Game Design — Creating rules, worlds, and gameplay experiences.

Cyber Safety — Staying safe while using technology online.

Robots — Machines programmed to complete tasks automatically.

Digital Art — Creative artwork made using technology.

Augmented Reality (AR) — Digital elements added to the real world.

Virtual Reality (VR) — Immersive digital environments and experiences.

Future Technology — New inventions and ideas shaping the future.

“ *The future is built by creators who understand technology.* ”
